Here are the setup instructions for Ubuntu 2204 and Ubuntu 2404. After following them, the "FRR_Workspace_Setup_Build" document can be followed. If any issues arise with the Dockerfile not being found, the Dockerfile located at "docker/ubuntu-ci/Dockerfile" should be used instead.

# Install prerequisite packages
sudo apt-get update
sudo apt-get install build-essential tmux docker.io git linux-modules-extra-$(uname -r)

# Add your user to the docker group to be able to run without using sudo
sudo usermod -a -G docker <username>

You MUST log out and then back in again to pick up the docker group for your user

# Load the required topotest kernel modules
sudo modprobe vrf && sudo modprobe mpls_router && sudo modprobe team

Verify the kernel modules are loaded
lsmod | grep -E "vrf|team|mpls"

Continue from here with the directions in "FRR_Workspace_Setup_Build"
